

LAN CONTROLLER

RESTARTER, MONITOR, WATCHDOG, CONTROLLER

FEATURES:

- WWW or SNMP v2 management.
- firmware upgrade via TFTP
- read data in real time without refresh page
- possibility switch on/off to 5 relay direct from page WWW
- events panel to self-programming by user
- Scheduler (switch on/off output for definite time in week days)
- Watchdog IP to five IP device
- monitoring od additional devices eg. sensors
- measurement: environment temperature, suplly voltage, temperature and current from conected sensors
- power measurement for DC voltage
- posisibility connection of the additional board with RJ45 ports (4 LAN Input, 4 ye LAN + PoE) or additional board with 4 relays
- Set time manauly or by server NTP
- Posisibility sensors calibration
- steering frequency and duty PWM
- e-mail notification about programmed events
- SNMP TRAP notification about programmed events
- Automatic send SNMP TRAP with state or value inputs
- implement protocols: HTTP, SNMP, SMTP, SNTP, ICMP, DNS, DHCP.
- service temperature sensors: NTC10K B=3950, KTY-84, PT1000

Default user and password is „admin”, IP adress is 192.168.1.100

TECHNICAL SPECIFICATIONS

- supply voltage: 8-36V (from 6V if don't use measurement current and PT1000)
- power consumption : about 1W
- PoE supply: YES, passive
- Protection from wrong supply polarization: YES
- interface: ethernet 10Mbit/s
- relay: 255VAC 10A
- work temperature: -20 do +85 st. C
- weight 45g (without casing)
- casing type Z-67 (not included)
- dimensions 57x67mm

INPUT/OUTPUT:

- 1 RELAY to switch on/off/ another devices, available contact: NC and NO
- 4 OUTPUT to switch relays, ports PoE or another devices;
- 1 STEERABLE OUTPUT PWM from 2,6 KHz to 4Mhz;
- 2 LOGICAL INPUT (max 12V): to monitoring another devices, eg. bufor supply.
collaboration with outputs: OC,NO, NC
- 5 ANALOG INPUT:

INP1: temperature measurement with thermistor NTC 10K B=3950(from -40 to +120 °C) or
thermistor KTY-84-130 (from -40 to +300°C), accuracy 1 °C (dependent on NTC)

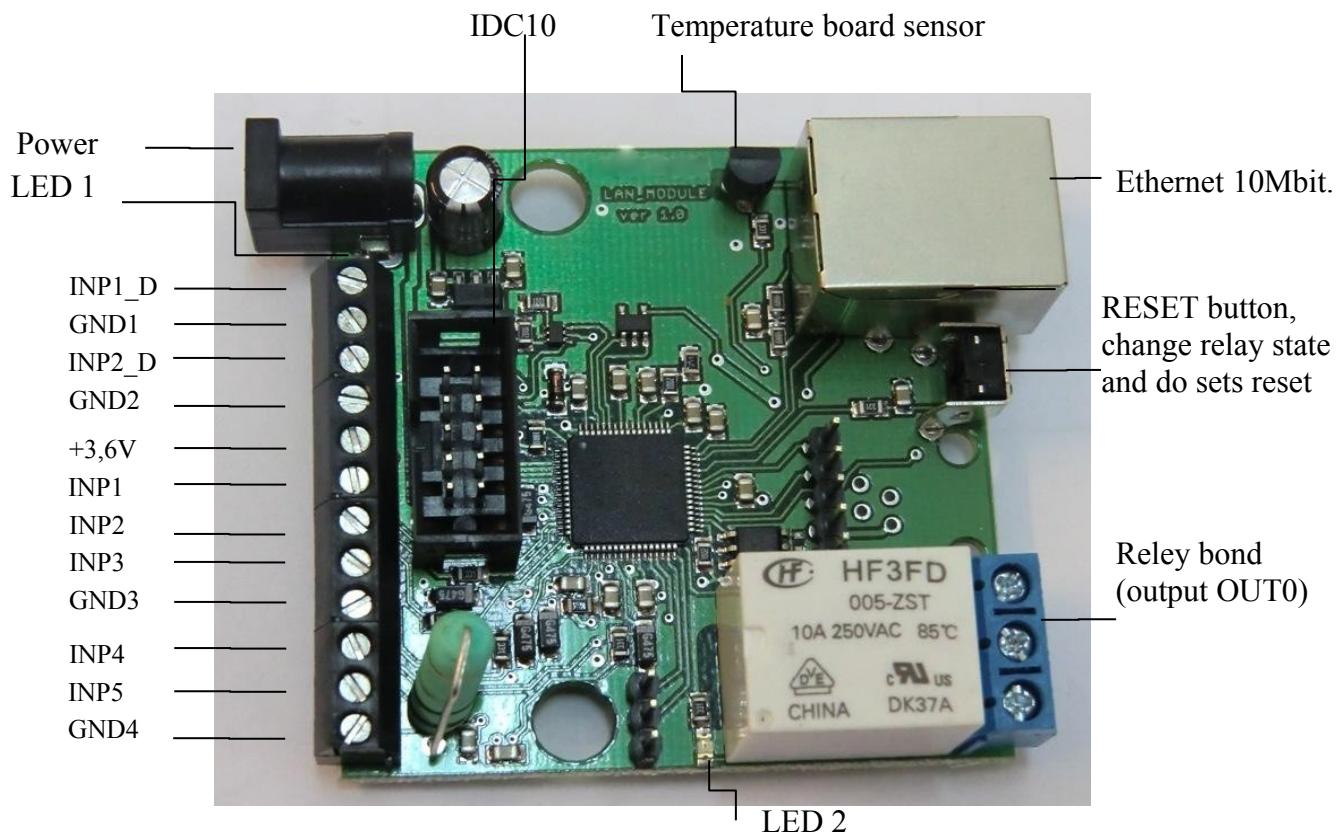

INP2: thermistor NTC 10K or voltage measurement to 3,6V, with use additional divider increase
range..

INP3: voltage measurement to 35V, accuracy +- 0,1V;

INP4: temperature measurement by PT1000 (from -20 to +850 °C) accuracy +- 2°C;

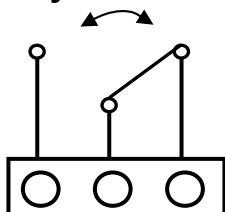

INP5: measurement DC current to 3A, accuracy +- 10mA;

PINS and COMPONENTS DESCRIPTION

PIN/Component	Description
Power	Power supply 8V-35VDC or via PoE
RELAY bond	To connect external device, detail description below
LED1	Shine LED means Power on board
LED2	Shine LED means relay active
IDC10	To connect additional board , detail description below
INP1_D	Logical input 1
GND1	gnd for INP1_D and INP2_D or general gnd
INP2_D	Logical input 2
GND2	general gnd
+3,6V	Supply for sensors NTC-10K and KTY-84 connected to INP1 or INP2
INP1	input for sensor NTC-10K or voltage measurement max (without divider) 3,6V
INP2	input for sensor NTC-10K Or KTY-84-130
INP3	input for voltage measurement max 35V
GND3	general gnd
INP4	input for sensor PT1000 or connected the same sensor in solar controller
INP5	Input for current measurement
GND4	Gnd for current measurement Or general if don't measurement current

Relay Bond:

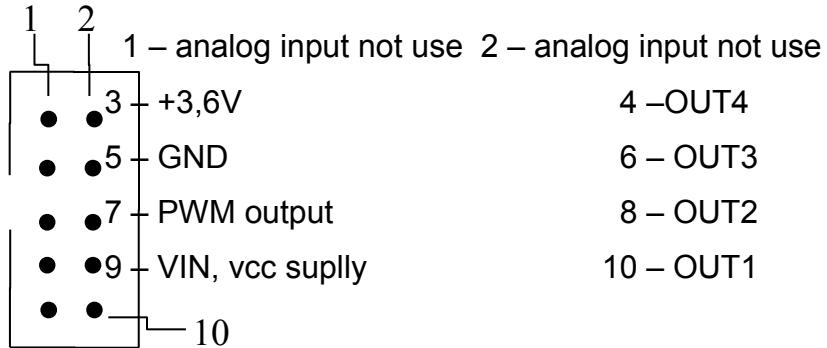

NO – contact normally open

CON – common contact

NZ – contact normally closed

ATTENTION: In spite of that relay can switch AC voltage 255 VAC 10A, board fail to comply with safety requirements (lack housing, earthing). Therefore that receiver connect with the assistance safety external relays eg. on DIN bus, controlled by relay on board.

IDC10

RESET BUTTON

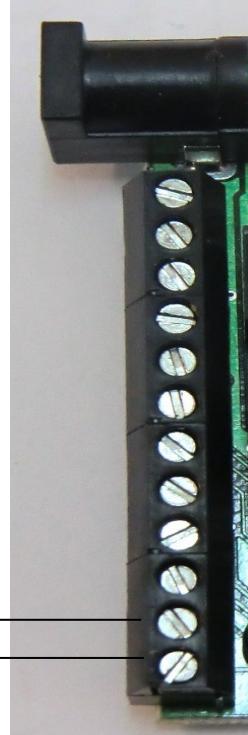

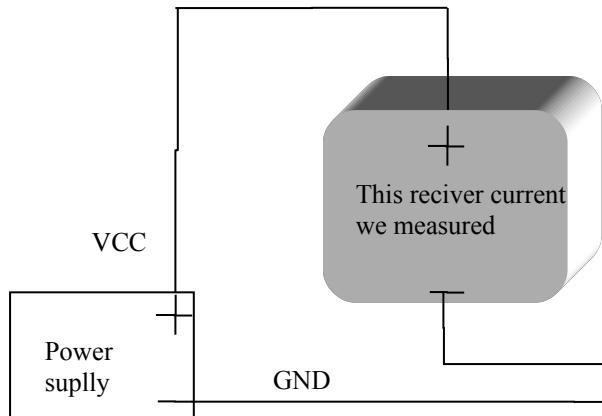

Push about 0,5 second cause change relay state on opposite, push and keep longer about 5 second (if we not logged by WWW on modul) cause modul reset, next if you still keep button about 10 second cause set all settings to default. Set all settings to default confirmation is fast switch relay on/off (klik-klik), don't wrong this with change relay state about 0,5s and switch relay off after restart.

User and password: admin

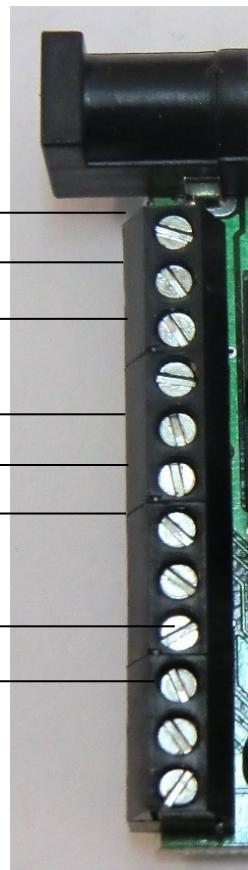

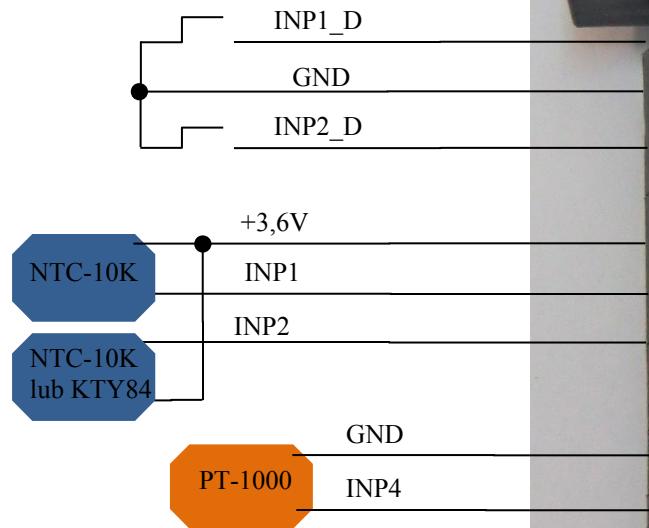

IP: 192.168.1.100

Sensors connect

1. Current measurement.

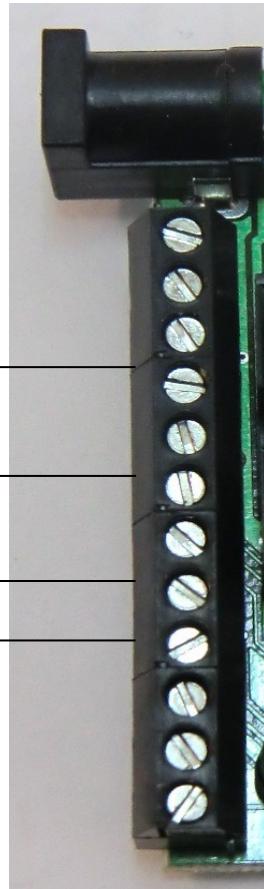

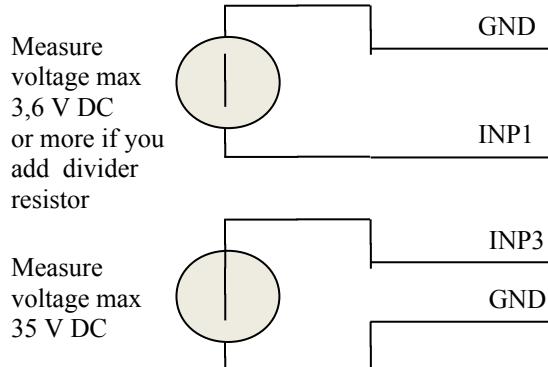

2. Temperature measurement and logical input.

3. Voltage measurement.

INP1 is used to measure temperature or voltage, in control panel you must choose what you want measure

Additional resistor to increase measure range INP1

R = 10K increase range 2 (multiplier 2) that is $3,6V \times 2 = 7,2V$

R= 20 K increase range 3 (multiplier 3)

R= 30 K increase range 4 (multiplier 4) etc.

Add resistor must be connected with set proper multiplier in field VCC on control panel page.

Management by WWW.

1. Control Panel

Change outputs state display

Any text description, max 8 chars

CONTROL PANEL

VCC SUPPLY = 8.2 V

Board Temperature = 29.1 °C

Digital Outputs Control ANALOG Inputs State

Reverse out state

Reset time [0]

[Out0 | Out1 | Out2 | Out3 | Out4]

Out0	Out1	Out2	Out3	Out4
OFF	OFF	OFF	OFF	OFF
●				
1 Off	2 Off	3 Off	4 Off	5 Off

Set State

PWM Output OFF

Frequency = 5008 Hz 5008

Duty = 50.0 % 50.0 Start

Input	Value	Unit	kal	Sensor type
Inp1	n/a	°C	0.0	<input checked="" type="radio"/> TEMP <input type="radio"/> VCC 0
Inp2	n/a	°C	0.0	<input checked="" type="radio"/> NTC10 <input type="radio"/> KTY84
Inp3	0.0	V	0.0	
Inp4	n/a	°C	0.0	<input checked="" type="radio"/> PT <input type="radio"/> SOLAR
Inp5	0.00	A	0.00	

Power measure

I3*I5	0.00	W	
P*t	0.000	Wh	Start Reset

Input1 HIGH

Input2 HIGH

• Push red or green circle to change output state or chose "Set State" button
• Reset time=0 normal outputs work ON/OFF

DIGITAL Inputs State

Klik cause change relay state on opposite (OUT0 relay on board)

Set state All output simultaneously according to combo box

Run PWM generator

Value of calibration

Run Power measure from INP3 (voltage) and INP5 (current)

Choce type connected sensor

Reset time – for 0 normal outputs work (ON/OFF), for time > 0 output after push button change state and return to state before after the specified time in seconds (max 65534).

2.Events Config (events panel)

Delay of set outputs after occur events, in seconds max
65535

Inputs		Outputs/Action										
Hysteresis		OUT0 <input type="checkbox"/> 0	OUT1 <input type="checkbox"/> 0	OUT2 <input type="checkbox"/> 0	OUT3 <input type="checkbox"/> 0	OUT4 <input type="checkbox"/> 0	PWM		E-mail		SNMP Trap	
		<input type="checkbox"/>	0.0 <input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
TEMP 0.0 <input type="checkbox"/>		0.0 <input type="checkbox"/>	0.0 <input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
VCC SUPPLY 0.0 <input type="checkbox"/>		0.0 <input type="checkbox"/>	0.0 <input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
INP1 °CV 0.0 <input type="checkbox"/>		0.0 <input type="checkbox"/>	0.0 <input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
INP2 °C 0.0 <input type="checkbox"/>		0.0 <input type="checkbox"/>	0.0 <input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
INP3 V 0.0 <input type="checkbox"/>		0.0 <input type="checkbox"/>	0.0 <input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
INP4 °C 0.0 <input type="checkbox"/>		0.0 <input type="checkbox"/>	0.0 <input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
INP5 A 0.00 <input type="checkbox"/>		0.00 <input type="checkbox"/>	0.00 <input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
INP1 DIG		<input type="checkbox"/>	<input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									
INP2 DIG		<input type="checkbox"/>	<input type="checkbox"/> 0 Hz <input type="checkbox"/> 0.0 %									

ON/OFF input Value when given output will be set ON Or generator PWM start or send e_mail or SNMP Trap

If check, given output will be set when value input increase

Save Config

Save settings (ON/OFF input you don't must save)

If check, means that is ON

Email text taht will be send if events occurrence, max amount char is 79. Chars „=“ and „&“ are not allowed

For logical input INP1D and INP2D, e-mail and SNMP Trap notification are send when input level change from 1 to 0 or 0 to 1, additional to email text (at end) will be add value 1 or 0 mark actual input state.

Config events description:

Example:

For INP1 field OUT0 is set to 20 and checkbox is check, the same values are set in field E_MAIL. Beginning value INP1 is 10, after certain time temperature increase and value INP1 is 20 or more, in this moment OUT0 will be ON (if was OFF) and email message will be send. After certain time temperature decrease, if decrease above 20 OUT0 will be OFF (if was ON), if temperature again exceed 20, email message will be send again and OUT0 will be ON.

3.Watchdog

WatchDog

<input type="checkbox"/> Enable IPO	IPO <input type="text" value="168.1.10.10"/>	OUT0: <input checked="" type="radio"/> ON <input type="radio"/> OFF <input type="radio"/> RESET= <input type="text" value="768"/> s PING Failures <input type="text" value="2"/>
<input type="checkbox"/> Enable IP1	IP1 <input type="text" value="168.1.10.10"/>	OUT1: <input checked="" type="radio"/> ON <input type="radio"/> OFF <input type="radio"/> RESET= <input type="text" value="768"/> s PING Failures <input type="text" value="2"/>
<input type="checkbox"/> Enable IP2	IP2 <input type="text" value="168.1.10.10"/>	OUT2: <input checked="" type="radio"/> ON <input type="radio"/> OFF <input type="radio"/> RESET= <input type="text" value="768"/> s PING Failures <input type="text" value="0"/>
<input type="checkbox"/> Enable IP3	IP3 <input type="text" value="168.1.10.10"/>	OUT3: <input checked="" type="radio"/> ON <input type="radio"/> OFF <input type="radio"/> RESET= <input type="text" value="768"/> s PING Failures <input type="text" value="0"/>
<input checked="" type="checkbox"/> Enable IP4	IP4 <input type="text" value="168.1.10.10"/>	OUT4: <input type="radio"/> ON <input type="radio"/> OFF <input checked="" type="radio"/> RESET= <input type="text" value="768"/> s PING Failures <input type="text" value="0"/>
30 <input type="text"/> s Wait time - before again ping, after event		
<input type="button" value="Save Config"/>		
Time to wait for respond is 4s		

When events occur, next ping to this same IPX will be send after this time (max 65535second)

Time to respond is 4 second, after this time one PING failures is counting. In time waiting to respond, another IPX aren't send ping, this may cause stretch time statement that another IPX address is inaccessible.

Amount PING failures, after this one of three events will be happen:
set (ON) output,
set (OFF) output
reset (ON/OFF) output on definite time (max 65535s).

4.Scheduler

Scheduler

Week Day

Mo-Monday, Tu- Tuesday, We- Wednesday, Th- Thursday, Fi- Friday, Sa- Saturday,
Su-Sunday, ## - all week day

Letter size is important

Format: number output(from 0 to 4),day1,day2,day3,day4,day5,day6, xx:xx:xx(time)

Example:

0,Mo,12:23:00 sets out0 every Monday at 12:23:00

1,Sa;Fi,Mo,23:22:03 sets out1 every Saturday,Friday and Monday at 23:22:03

1,Sa;Fi,Mo,Tu,Su,Th,23:22:03 sets out1 every Saturday, Friday, Monday, Tuesday, Sunday and Thursday at 23:22:03

0,##,12:01:30 - sets out0 every week day at 12:01:30

Reset – time in second (max 65535).

Firmware Upgrade.

You may upgrade firmware on two ways:

1. By dedicated software „LAN Controller Tools”(find controller or put IP and click „Upgrade Firmware”).
2. By any TFTP client, description below.

Send firmware file by TFTP, you have 5 second (Green LED on RJ45 socket blink) to start send firmware when module runs after reset (you may cause reset by clicking button „Save config and Reboot” in Network configuration or „Reset” button on board or dedicated software „LAN Controller Tools”). If start transmission does not happen, the device starts work normally. If tftp transmission begins, it will wait about 90 seconds to finish uploading firmware. After upload, the device will be reset and start normally.

If you want to upload upgrade file, choose „Save config and Reboot” in Network configuration or power OFF and power ON device.

The file must be sent in binary mode eg. In Windows XP tftp client

tftp -i 192.168.1.100 put „file_upgrade.bin”.

```
C:\>tftp -i 192.168.1.100 put "firmware_lan_1.0.bin"
Przesłano pomyślnie: bajtów: 321664 w 79 ss, bajtów/s: 4071
